

レーザー干渉計型重力波検出器

Laser interferometric gravitational wave detectors

1. Introduction

Yuta Michimura

RESCEU, University of Tokyo

michimura@resceu.s.u-tokyo.ac.jp

SLIDES

About Me

- Yuta Michimura 道村 唯太
- Born in 1987
- 博士(理学) in 2015
Kimio Tsubono & Masaki Ando - **Quantum gravity**
- 2014-2022 Assistant Professor
Department of Physics,
The University of Tokyo
- 2022-2024 Research Scientist
LIGO Laboratory,
California Institute of Technology
- 2024- Associate Professor
Research Center for the Early Universe,
The University of Tokyo

Interested in

- Gravitational waves
- Dark matter
- Tests of gravity
- **Quantum gravity**

RESCEU (ビッグバンセンター)

Objectives of This Lecture Series

- レーザー干渉計を用いた重力波検出の原理や感度を上げる方法、重力波観測の現状と将来計画について理解を深めることを目標とする。また、重力波観測技術の応用例についても紹介する。
- The goal of this course is to deepen the understanding of the principles of gravitational wave detection using laser interferometers, methods to improve sensitivity, the current status of gravitational wave observations, and future plans. Additionally, applications of gravitational wave observation technology will be introduced.

Topics Covered

- Current status of gravitational wave observations
- Laser interferometers and optical cavities
- Fundamentals of spectral analysis
- Seismic noise and thermal noise
- Quantum noise
- Applications of gravitational wave techniques to other fields
- Next-generation gravitational wave telescopes and space-based gravitational wave telescopes
- *Open to any suggestions!*

Further Reading

- Eric D. Black, Ryan N. Gutenkunst, *An introduction to signal extraction in interferometric gravitational wave detectors*, [Am. J. Phys. 71, 365 \(2003\)](#)
- Peter R. Saulson, *Fundamentals of Interferometric Gravitational Wave Detectors* (World Scientific, 1994)
- 中村卓史, 三尾典克, 大橋正健 編著『重力波をとらえる』(京都大学学術出版会, 1998)
- 日野幹雄『スペクトル解析』(朝倉書店, 2010)
- 片山徹『フィードバック制御の基礎』(朝倉書店, 2002)
- 東京大学 物理学実験II [ブラウン運動 テキスト](#)

Logistics

- In-class small assignment given at the beginning of each lecture
- ~10 min at the end of each lecture will be allocated for answering and answer sheets will be collected
- Schedule:
 - Oct 20 (Mon) 2限 10:25-12:10
 - Oct 24 (Fri) 3限 13:00-14:45
 - Oct 31 (Fri) 3限 13:00-14:45
 - Nov 17 (Mon) 2限 10:25-12:10
 - Nov 25 (Tue) 2限 10:25-12:10 (Monday classes)
 - Nov 28 (Fri) 3限 13:00-14:45
 - Dec 5 (Fri) 3限 13:00-14:45
- Slides can be downloaded from the link below:
<https://yutamich.gitlab.io/lectures.html#lectures>

Assignment for Oct 20

- What would you like to hear or learn about in this lecture series?
- You may also answer from the Google Form below

GW150914: First Sound

- **September 14, 2015:**
Two LIGO detectors in the US detected gravitational waves from **merging black holes**
→ Beginning of astronomy with “**sound**”
- **1609:** Galileo made telescopes
→ Beginning of astronomy with “**light**” (electromagnetic waves)

Plan of the Lecture Today

- **What are gravitational waves?**
 - Einstein's general relativity
- **History of gravitational wave observations**
 - It took 100 years to detect them
- **The status of gravitational wave observations**
 - By LIGO-Virgo-KAGRA detectors
- **How do we detect them?**
 - Laser interferometer

Gravity in General Relativity

- **space-time bends** with presence of mass
- bending affects motion of objects → **gravity**

T. Pyle/Caltech/MIT/LIGO Lab

Gravitational Waves

- ripples in space-time created by motion of objects

Characteristics of GWs

- propagates at the **speed of light**
- **quadrupole** radiation (+ mode and x mode)
- high **transmissivity** $\leftrightarrow$ very weak interaction

- large mass and large acceleration creates large GW
- GW strain
= **fraction of length change**

$$h = \frac{\delta L}{L}$$

Amplitude So Small

Amoeba $\sim 10^{-4}$ m

Atom $\sim 10^{-10}$ m

Proton $\sim 10^{-15}$ m

Strain
 10^{-21}

← Seismic vibrations
 $\sim 10^{-6}$ m

← Thermal vibrations
 $\sim 10^{-15}$ m

← Quantum limit
 $\sim 10^{-20}$ m

Target sensitivity

Heisenberg's
uncertainty
principle

History of Gravitational Waves

- 1915 Einstein formulated General Relativity
- 1916 Einstein predicted gravitational waves
- 1936 Einstein submitted a paper saying that GWs do not exist on second thought
→ got criticized and got angry
- 1957 Chapel Hill Conference
Feynman's "sticky bead argument"
GWs started to theoretically accepted

Howard Robertson

Richard Feynman John Wheeler

Pulsars and Indirect Evidence

- 1967 Bell and Hewish discovered a radio source which has 0.04 sec pulse with a period of 1.3373011 sec
→ **Pulsar** (later discovered to be a neutron star)

1974

Little green men 1

Pulsars and Indirect Evidence

- 1974 Hulse and Taylor discovered a binary pulsar

Arecibo Observatory

1993

Weber's "Detection"

- 1969 Joseph Weber claimed a detection of gravitational waves
- Later discovered to be wrong
- But this motivated for direct detection

J. Weber, [PRL 22, 1320 \(1969\)](#)

Follow-up Experiments in Japan

Hiromasa Hirakawa, 1971

GW experiments in Japan started at Hongo Campus

Kimio Tsubono

Laser Interferometric Detectors

- 1960s Rai Weiss got the idea when he had to teach a graduate course on general relativity at MIT

Internal Report 1972

Fig. V-20. Proposed antenna. LIGO-P720002

Laser Interferometric GW Detectors

- Measures **differential** arm length change

Laser Interferometric GW Detectors

- Measures **differential** arm length change

Interferometer Control

- **Control** mirror positions to “lock” the fringe

Linear System

- **Control** makes the system **linear**

Noises and Sensitivity

- Noises in the loop limits the sensitivity

Things You Need to Know

History of Laser Interferometers

- 1970s-1980s **Prototypes** at MIT (1.5 m→5 m) / Garching, Germany (3 m→30 m) / Glasgow, Scotland / Caltech (40 m) / ISAS TENKO (10 m→100 m) / UTokyo (3 m)
- 1984 **LIGO** project started by Drever, Weiss, and Thorne
- 1995 TAMA300 started construction in Mitaka
- 2000 **TAMA300** recorded the best sensitivity
- 2000s Initial detectors started operation (1G)
LIGO (US, 4 km) / TAMA300 (Japan, 300 m)
GEO600 (Germany, 600 m) / Virgo (Italy, 3 km)
- 2011 LIGO started upgrade
- 2015 Advanced LIGO started observing run, and **first detection**

First Detection by LIGO Detectors

- On September 15, 2015, **two detectors** separated by ~3000 km detected almost simultaneously

LIGO Hanford

Binary Black Hole Merger

- Two black holes merging into one

<https://youtu.be/c-2XluNFgD0>

-0.76s

Distance and Mass from Waveform

- $36 M_{\text{sun}} + 29 M_{\text{sun}} \rightarrow 62 M_{\text{sun}}$

Distance
from
amplitude

Binary Neutron Star Merger

- GW170817
- Coincident detection of gamma ray burst later with other electromagnetic observations
- **Multimessenger astronomy**

Binary Neutron Star Merger

- Short gamma ray burst after gravitational waves

<https://youtu.be/e7LcmWiclOs>

Origin of Heavy Elements

- From light curves after the merger, evidence for **r-process elements** was found (kilonova)

K. Kawaguchi+,

From merging neutron stars

Neutron Star Open Questions

- What happened **after the merger**?
- What are the progenitors of **GRBs** and **kilonovae**?
 - Short/long GRBs explained by BNS?
 - Diversity of kilonovae? c.f. GRB211211A, GRB230307A
- Can BNS mergers explain the origin of all **heavy elements**?
- QCD **phase transition**?

Fujimoto+,
[PRL 130, 091404 \(2023\)](#)

GRB230307A Excess

- Not collapsar due to large offset (~ 40 kpc) from host galaxy
- Likely BNS merger but long GRB (~ 35 sec)
- Similar kilonova to 170817 but extremely red

A. J. Levan+, [Nature 626, 737 \(2024\)](#)

Sound from Binary Coalescences

- Louder if closer, tone is higher if mass is lighter

SOUND OF GRAVITATIONAL WAVES

Mass of Events Detected So Far

Latest list including O4a results released on Aug 25, 2025

Mass of Events Detected So Far

Super-Massive Black Holes

Center of galaxies

Intermediate-Mass Black Holes

LIGO-Virgo-KAGRA Black Holes *LIGO-Virgo-KAGRA Neutron Stars* *EM Black Holes* *EM Neutron Stars*

of unknown origin ($> \sim 100 M_{\odot}$)

Pair-instability mass gap ($65-130 M_{\odot}$)

Stellar-Mass Black Holes

from gravitational collapse of stars

($\sim 5-65 M_{\odot}$)

重力学観測で
見つかった中性子星
Lower mass gap ($3-5 M_{\odot}$)

Neutron stars ($< \sim 2 M_{\odot}$)

How do stars shine?

- Stars support its gravity with **nuclear fusion**
- Stars will **gravitationally collapse** in the end

Iron is the most stable

Nuclear Fusion and Fission

- Gravitational collapse creates **heavy elements**
- Nuclear fission** creates energy
→ Atomic bomb

I am
become
Death, the
destroyer
of worlds

Fate of Heavy Stars

- Mass gap** between neutron stars and black holes, upper mass gap due to pair-instability supernovae

Population Studies

- Peaks at $\sim 10 M_{\odot}$ and $\sim 35 M_{\odot}$, origin uncertain
- Studies on spin to find out if binaries are formed in isolation or dynamically

Tests of General Relativity

- Novel tests in **strong-field** regime
- Inspiral and post-inspiral signals are **consistent**
- No evidence for beyond-GR **polarizations**
 - Need for 4+ detectors to distinguish 4+ polarizations
- **Graviton mass** $< 1.3 \times 10^{-23}$ eV

Takeda+, [PRD 98, 022008 \(2018\)](#)

LVK, [arXiv:2112.06861](#)

Cosmic Expansion Measurements

- Using luminosity distance measured by GW
- **Dark siren** also possible by using a galaxy catalog
- Independent test of DESI BAO dynamical dark energy results should be possible in the future e.g. [arXiv:2504.04646](https://arxiv.org/abs/2504.04646)

With BBH x galaxy catalog

(dependent on assumptions on BBH source mass distribution)

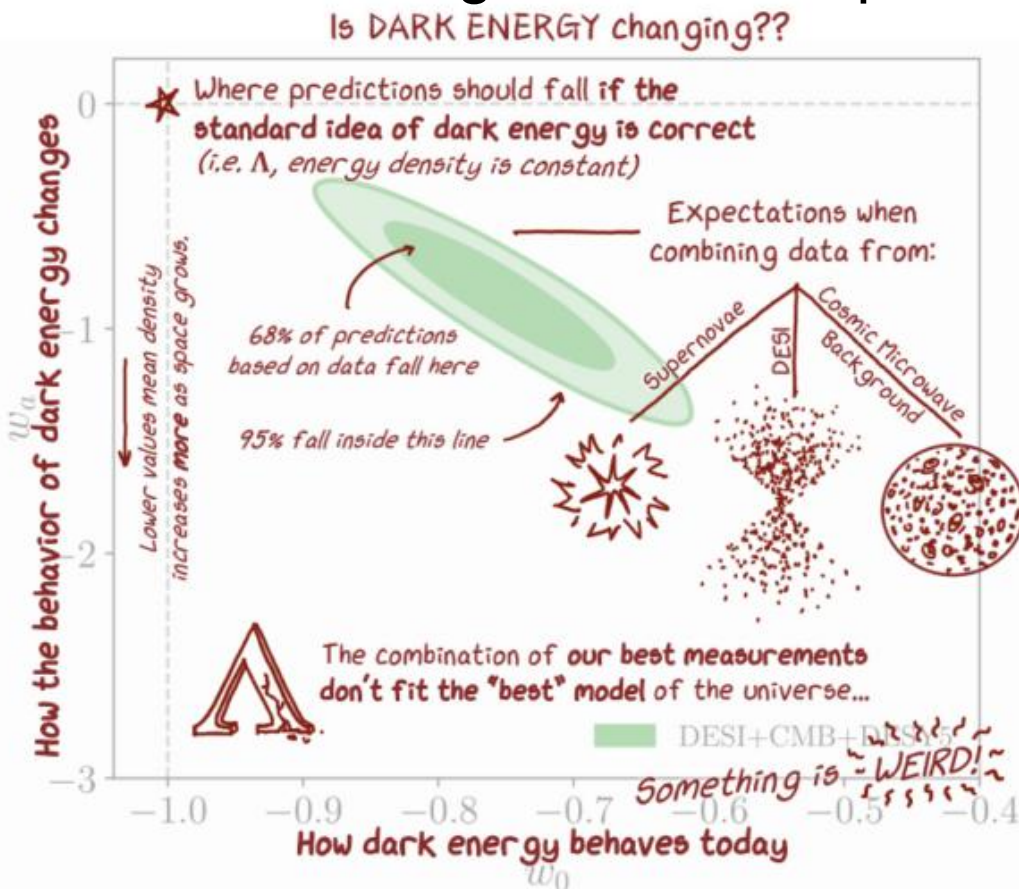

GW170817 only

LVK, [arXiv:2509.04348](https://arxiv.org/abs/2509.04348)

DESI Results for Cosmic Expansion

- Dark Energy Spectroscopic Instrument Data Release 2
 - 4 m optical telescope in Arizona
- Baryon acoustic oscillation measurements from more than 14 million galaxies and quasars

DESI, [arXiv:2503.14738](https://arxiv.org/abs/2503.14738)

$$w(z) = w_0 + w_a \frac{z}{1+z}$$

$\uparrow$ $\uparrow$ 2.8-4.2 σ tension
 -1 0
 is Λ CDM

Cosmological constant is not constant?
Violation of Λ CDM?

Searches for New Physics

Personal Picks!

Ultralight dark matter ($10^{-13} \sim 10^{-11}$ eV range)

Vector DM from LV

LVK, [MNRAS 524, 5984 \(2023\)](#)

GW230529: Lightest NS-BH?

- Single detector event, no EM counterparts

LVK, [ApJL 970, L34 \(2024\)](#)

FILLING THE MASS $\longleftrightarrow$ **GAP**
with observations of compact binaries from gravitational waves

Mass of compact object ($M_{\odot}$) 1 2 3 4 5 6

Includes components of compact binary mergers detected with a False Alarm Rate (FAR) of less than 0.25 per year

GW231123: Heaviest BBH

- Released on July 10, 2025

LVK, [arXiv:2507.08219](https://arxiv.org/abs/2507.08219)

GW250114: Loudest BBH

LVK, [PRL 135, 111403 \(2025\)](#)

- Released on September 9, 2025
- Network SNR of 80 (Hanford + Livingston)
- Confirmation of overtones
- Hawking's area law (BH entropy increases)

LVK, [arXiv:2509.08054](#)

Global Network of GW Detectors

Why Multiple Detectors?

- Triangulation for **sky localization**
→ allows to look for electro-magnetic counterparts (hear and see the event)
- Measure **polarization** of GWs to estimate distance better
→ Hubble constant
- Look for non-standard GW polarizations to **test general relativity**

First binary neutron
star event (GW170817)

LIGO-Virgo-KAGRA Observations

- **Coordinated runs** to detect GW signals by multiple detectors for better sky localization etc.

Today: O4c observing run

Inspiral Range

- x2 the sensitivity, x8 the detection rate

Now in O4 Observing Run

O1+O2+O3+O4a = 218, O4b* = 105, O4c* = 54, Total = 377

Next Generation Detectors

- Next generation detectors coming in **late 2030s**, **with space-based** detectors (multi-band!)

LIGO India

Cosmic Explorer

Einstein Telescope

B-DECIGO

LISA

Einstein Telescope

- Xylophone configuration
 - 10 K silicon interferometer for low frequency
 - Room temp. fused silica interferometer for high frequency
- 10 km Δ or two 15 km L, underground

Branchesi+, [JCAP 07, 068 \(2023\)](#)

Cosmic Explorer

- 40 km and 20 km L-shaped
 - 40 km only if ET in Europe
- Room temp. fused silica (technical overlap with A#)

Space-Based Detectors in 2030s

- Arm length of $O(10)$ km is a limit for ground-based
- Also, **seismic** isolation below 10 Hz is tough

→ Space-based detectors

- LISA(りさ): 1-10 mHz region
 - ESA-lead
 - To be launched **2035**
 - LISA Pathfinder succeeded in 2016
 - Similar Chinese projects: **TianQin** (天琴), **Taiji** (太極)
- DECIGO(でさいご): 0.1-10 Hz region
 - Japan, 2030s

Pulsar Timing Array

- Measures arrival times of pulses for years
- June 2023: Evidence for GW background
 - NANOGrav: North America (15 years of data)
 - EPTA: Europe
 - PPTA: Australia
 - InPTA: India
 - CPTA: China
- Superposition of GWs from many super-massive BHs?

Celebration
@Caltech

Cosmic Microwave Background

- CMB: Nearly isotropic 2.725 K black body radiation from the universe
- Primordial GWs can be measured with **polarization measurements**
- LiteBIRD
Aiming for 2032 launch
- Simons Observatory
Observation started 2024

Summary

- Gravitational wave astronomy has just started
- First event on September 15, 2015
- We now have more than 300 events
- **Detector improvements** are necessary for better understanding of the universe
 - Neutron star physics
 - Origin of heavy elements
 - Origin of black holes
 - Cosmic expansion
 - Tests of gravity etc...
- Developments in other frequency bands are also underway
